Soap is the term for a salt of a fatty acid or for a variety of cleansing and lubricating products produced from such a substance. Household uses for soaps include washing, bathing, and other types of housekeeping, where soaps act as surfactants, emulsifying oils to enable them to be carried away by water. In industry, they are used as thickeners, components of some lubricants, and precursors ...

Jesse J. Williams, in Handbook for Cleaning/Decontamination of Surfaces, 2007 5.2.1.2. Anionic surfactants. Anionic surfactants work best to remove dirt, clay, and some oily stains. These surfactants work following ionization. When added to water, the anionic surfactants ionize and have a negative charge. The negatively charged surfactants bind to positively charged particles like clay.

342 Chapter 8 Acids, Bases, and Acid-Base Reactions Ammonia is an Arrhenius base because it produces OH<sup>-</sup> ions when added to water. Because the reaction is reversible, however, only some ammonia molecules have acquired protons (creating OH<sup>-</sup>) at any given time, so an ammonia solution contains fewer hydroxide ions than would be found in a solution made using an equivalent

Saponins consist of an aglycone unit linked to one or more carbohydrate chains (Figure 1). The aglycone or sapogenin unit consists of either a sterol or the more common triterpene unit. In both the steroid and triterpenoid saponins, the carbohydrate side-chain is usually attached to the 3 carbon of the sapogenin.
