Fuel injection is the introduction of fuel in an internal combustion engine, most commonly automotive engines, by the means of an injector.. All diesel engines use fuel injection by design. Petrol engines can use gasoline direct injection, where the fuel is directly delivered into the combustion chamber, or indirect injection where the fuel is mixed with air before the intake stroke.

Urea-SCR, the selective catalytic reduction using urea as reducing agent, has been investigated for about 10 years in detail and today is a well established technique for DeNO<sub>x</sub> of stationary diesel engines. It is presently also considered as the most promising way to diminish NO<sub>x</sub> emissions originating from heavy duty vehicles, especially trucks.. The paper discusses the fundamental problems ...

A free-piston engine is a linear, 'crankless' internal combustion engine, in which the piston motion is not controlled by a crankshaft but determined by the interaction of forces from the combustion chamber gases, a rebound device (e.g., a piston in a closed cylinder) and a load device (e.g. a gas compressor or a linear alternator).. The purpose of all such piston engines is to generate power.

Although it's one of the most important aspects of electrical design and installation, grounding continues to be one of the least understood and most misinterpreted concepts in the industry. It's also one of the most expensive when errors are made. The dollar value of equipment in-operation and/or loss not to mention the potential liability associated with ground-fault arcing can be staggering.
