There are two stages or phases of meiosis: meiosis I and meiosis II. Before a dividing cell enters meiosis, it undergoes a period of growth called interphase. At the end of the meiotic process, four daughter cells are produced.

Mitosis is the process that a somatic cell divides into two daughter cells. It is an important process in normal organism development. Meiosis is the type of cell division by which germ cells (eggs and sperm) are produced. Meiosis involves a reduction in the amount of genetic material. Both types of cell division have similar phases: prophase, prometaphase, metaphase, anaphase and telophase.

Human somatic cells, with their full set of 46 chromosomes, have what geneticists refer to as a diploid number of chromosomes. Gametes have a haploid number (23). When conception occurs, a human sperm and ovum combine their chromosomes to make a zygote (fertilized egg) with 46 chromosomes. This is the same number that the parents each had in their somatic cells.

Epigenetics is the study of changes in gene activity which are not caused by changes in the DNA sequence. It is the study of gene expression, the way genes bring about their phenotypic effects.. These changes in gene activity may stay for the remainder of the cell's life and may also last for many generations of cells, through cell divisions.However, there is no change in the underlying DNA ...
