C m is the molal concentration expressed in moles of solute dissolved per kilogram of solvent (mol/kg) (Molal or m). This is also referred to as molality, which is defined as the number of moles of solute dissolved per kilogram of solvent (mol/kg = m). A 1.00 m solution is one in which exactly 1.00 mole of solute is dissolved in exactly 1.00 kg of solvent.

R f values are calculated by looking at the distance each component travels on the chromatography paper compared to the distance traveled by the solvent front. This ratio will be different for each component due to its unique chemical properties. When measuring the distance the component traveled, you should measure from the origin (where the middle of the spot originally was) and then to the ...

A solution is a liquid mixture with two or more components. The liquid part of the mixture is called the solvent, and the smaller dissolved part of the mixture is called the solute. Solutions are assumed to be uniform mixtures, meaning that the solute is evenly spread throughout the whole mixture. When the solvent of a liquid solution is water, we refer to the solution as an aqueous solution.
